

### 3.2 Differences between the positive and negative versions of the Signet

The negative version of the Signet requires an additional outline on the outer contour of the shield of width  $A \times 1.85$ . In addition, the crown should be moved upwards in the vertical axis by the equivalent of  $A \times 1.24$ .

The use of these procedures ensures the legibility and correct functioning of the Signet when used on solid tints.

Key:

-  Outline of the positive version
-  Outline of the negative version

#### IMPORTANT!

THE NEGATIVE VERSION SHOULD ONLY BE USED FROM THE FILE SO DESIGNATED. IT IS FORBIDDEN TO ADD AN OUTLINE TO THE BASIC VERSION OF THE SIGNET.
